

RPM Check Printing Information

RPM does not use one specific type of check. The layout can be customized in RPM to work with most checks you get (on the Check Layout screen under the Utilities, Set Up menu in RPM). We usually recommend Peachtree or Quickbooks compatible checks. The checks must be business size, not personal size checks and can be up to letter size paper. The check stubs should be blank and not have lines or boxes since the RPM check stub layout is a fixed layout.

You can see some examples of checks you can use on the links below:

Voucher checks (one check per page with two stubs):

<https://www.compuchecks.com/CheckMiddle.htm>

Voucher checks (one check per page with two stubs):

<https://www.compuchecks.com/CheckTop.htm>

Standard checks (three checks per page):

<https://www.compuchecks.com/threecheck.htm>

You can also purchase blank check paper and print all of the information on the checks yourself. If you do this, you need to use a MICR font and toner as described below.

For individual accounts, you need to print the encoding line (check number, routing and account number) on the checks so all of your clients can share the same check paper. You can also do this for mass accounts but most people use pre-printed checks for mass accounts. To print the encoding line, you need to use a MICR font and MICR toner. You can search on the internet for MICR toner suppliers for your specific printer.

RPM is set up to use a specific MICR font. The only fonts that will work with RPM are included in the RPM Client install: MICR, MICRN, MICRN2, MICRW, MICRW2, MICRdark, MICRdarkN, MICRdarkN2, MICRdarkW or MICRdarkW2.
